Accessibility of Board-Certified Pharmacists for Patients Living in Rural Areas of Texas

Kaden D. Ridley, Pharm.D., BCPS, Krystal K. Haase, Pharm.D., FCCP, BCPS, BCCCP, Eric J. MacLaughlin, Pharm.D., FASHP, FCCP, BCPS

Introduction

- Equitable access to healthcare is a significant problem in the United States, particularly in non-metropolitan areas.
- Clinical pharmacists functioning in advanced practice roles are well-positioned to improve medication-related outcomes and may assist in bridging the gap of healthcare disparities in rural and underserved areas.
- Board certification is often considered "the gold standard for determining which pharmacists are qualified to contribute at advanced practice levels" 1 and may serve as a valuable tool for characterizing the distribution and accessibility of advanced practice pharmacists.
- We sought to characterize the geographic representation of board-certified pharmacists (BCPs) practicing in Texas based on rurality and the demography of healthcare populations.
- Identification and characterization of the accessibility of advanced-practice pharmacists may inform future payment, legislation, advocacy, training, and credentialing efforts.

Objectives

Objective 1: Characterize board-certification of pharmacists in Texas based on geographical location, including rural and nonrural areas of Texas

Objective 2: Determine specific areas of underrepresentation and unique attributes of certain areas of Texas

Objective 3: Identify and evaluate the role board-certified pharmacists serve in rural practice settings

Methods

- Cross-sectional, county-level analysis
- Board-certified pharmacists were identified from the Board of Pharmacy Specialties (BPS) public database by location and cross-referenced with Texas State Board of Pharmacy (TSBP) data.
- Pharmacist practice location was categorized by Rural-Urban Commuting Area (RUCA) code based on ZIP code.
- Missing practice ZIP codes were identified from external sources (e.g., LinkedIn, organizational directories) when available.
- Pharmacists no longer residing in Texas, in non-practicebased employment, or where physical practice location could not be determined were excluded from Geographic analysis.
- Chloropleth maps were constructed by county and per 100,000 population based on 2020 US Census Bureau data.
- · Pharmacist and practice characteristics were described.

320 (12.4)

3,276 certificants identified through BPS public data with 2,576 included after cross-reference to TSBP data set. Of those, 518 were excluded (primarily due to lack of documented practice ZIP).

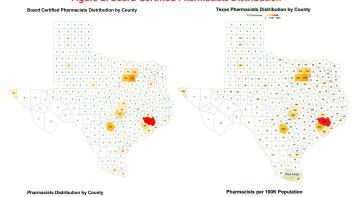

Of 20,614 actively licensed pharmacists, 3,276 (15.9%) are board-certified. BCPs are primarily employed in hospital, government, and educational settings.

Figure 1: BPS Pharmacist Specialties

Results

Figure 2: Board-Certified Pharmacists Distribution

Board-certified pharmacists are clustered in major population centers. 70% of counties have no certified pharmacists.

Table 2: Distribution by RUCA Code

Tab	le 2: Distribution by		
	RUCA Code	Definition	Number of Pharmacists (%)
1-3	Metropolitan area	Urbanized Areas of 50,000 or more people plus commuting areas	2011 (97.7)
4-6	Micropolitan area	Large urban clusters of 10,000 - 50,000 people plus commuting areas	41 (2)
7-9	Small town	Small urban clusters of 2,500 - 10,000 people plus commuting areas	6 (0.3%)
10	Rural area	All population, housing, and territory not included within an urbanized area	0

Collaborative drug therapy management (CDTM)

- 289 pharmacists in Texas have one or more registered collaborated practice agreements
- 50.5% of CDTM pharmacists are board-certified
- Based on available practice ZIP codes, all but one CDTM pharmacist practice in large metropolitan areas

Limitations

- Self-report bias has a potentially significant impact on the analysis of geographic distribution of BCPs as some key information was not included in several individuals, which may account for certain discrepancies in varying analyses.
- The use of geographic distribution may only be suggestive as a surrogate for access to care.

Conclusions

- BCPs are heavily distributed in metropolitan areas with less than 2.5% providing representation in micropolitan or small-town areas.
- No BCPs were characterized to be providing care in rural areas
- County distributions of BCPs vs. all licensed Texas pharmacists follow similar patterns of geographic location.
- Patients in rural Texas do not have access to advanced trained certified pharmacists
- Additional workforce data, including role delineation are needed to fully characterize the certified

 workforce.
- Further research is needed to evaluate healthcare disparities and access to care provided by BCPs.
